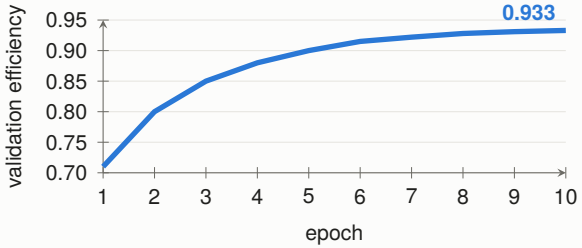
EXAMPLE · PROJECT

EXAMPLE: GNN track-finding efficiency study

A fictional check-in showing the intended structure and density

Alex Researcher · 20 October 2026

Validation efficiency is flattening near 0.93 after ten epochs.



Example data, not a real run

source: fictional validation log · epochs 1 to 10

- Efficiency gains slow after epoch six.
- Latest value is 0.933.
- **ok** on track for the 3 Nov review.

The next check-in will test whether the plateau is data-limited.

NEXT STEPS

1. Run the larger training sample.
2. Scan the pruning threshold.
3. Compare efficiency by particle momentum.
