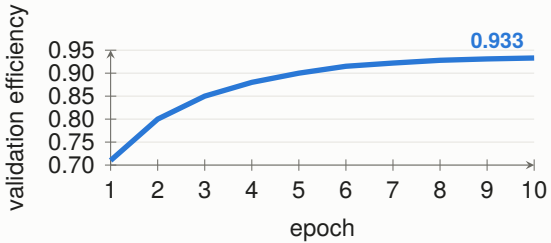
EXAMPLE: GNN track-finding efficiency study

A fictional check-in showing the intended structure and density

Alex Researcher · 20 October 2026

Validation efficiency is flattening near 0.93 after ten epochs.

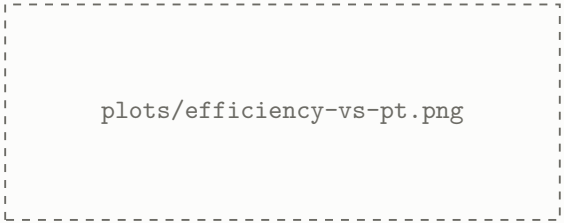


Validation efficiency per epoch, fictional run

- Gains slow after epoch six.
- Latest value is 0.933.
- • **ok** on track for the 3 Nov review.

source: fictional validation log · epochs 1 to 10

The momentum scan is the one open item before the review.



Missing figures compile as a dashed placeholder

- One bullet is fine.

The next check-in will test whether the plateau is data-limited.

Next steps

1. Run the larger training sample.
2. Scan the pruning threshold.
3. Compare efficiency by particle momentum.

Blockers

▲ **waiting** GPU queue allocation

■ **blocked** label audit approval
